

PAPER / POLYESTER DIELECTRIC EXTENDED FOIL ELECTRODES

FEATURES

- Moderate cost
- Small size
- High peak current ratings
- High corona starting voltage
- Approved to MIL-PRF-19978

MAJOR APPLICATIONS:

High voltage, high current, high pulse operations, protection circuits, and snubber applications.

PHYSICAL CHARACTERISTICS

CONSTRUCTION:

Non-inductive wound paper / polyester dielectric with extended foil electrodes. Impregnated with vitamin Q.

CASE:

Hermetically sealed metal enclosure. Styles and dimensions are in Guide to Ordering section in the front of the catalog.

LEAD MATERIAL:

Solder coated solid wire.

LEAD WIRE SIZES:

Case Dia.	Lead AWG
< 0.235	No. 24
< 0.235 and 0.312	No. 22
0.400 and over	No. 20

LEAD PULL:

5 lbs (2.3 kg) for one minute. No physical damage.

LEAD BEND:

After three complete consecutive bends. No damage.

MARKING:

Dearborn trademark, type or catalog number, capacitance, tolerance, and voltage.

ELECTRICAL SPECIFICATIONS

CAPACITANCE RANGE:

0.001 μ F to 1.0 μ F

VOLTAGE RATING:

100 VDC to 1,000 VDC

CAPACITANCE TOLERANCE:

\pm 20%, \pm 10%, \pm 5%

OPERATING TEMPERATURE:

-65°C to +125°C

VOLTAGE DERATING:

At +125°C, 50% of the 85°C rating

DISSIPATION FACTOR:

1.0% maximum

DC VOLTAGE TEST:

200% of rated voltage for 2 minutes

INSULATION RESISTANCE:

Measure at rated VDC or 500 V, whichever is less, after a 2 minute charge.

- At +25°C, 20,000 Megaohm-Microfarads, need not exceed 30,000 Megaohms
- At +125°C, 20 Megaohm-Microfarads, need not exceed 250 Megaohms

MAXIMUM PULSE RISE TIME

Capacitor Length (inch)	Rise Time dv / dt (V / μ s)					
	100 VDC	200 VDC	300 VDC	400 VDC	600 VDC	1,000 VDC

TYPICAL CHARACTERISTICS

CAPACITANCE CHANGE VS. TEMPERATURE

INSULATION RESISTANCE VS. TEMPERATURE

DISSIPATION FACTOR VS. TEMPERATURE

Measured at 1kHz

PROPERTIES OF DIELECTRIC FILMS

POLYESTER (Polyethylene Terephthalate, P.E.T.)

Capacitors with smaller dimensions can be manufactured due to the high dielectric constant and excellent electrical performance of this film. Metalized polyester capacitors also have outstanding self-healing properties.

POLYPROPYLENE (P.P.)

This film features very low dielectric losses, low dielectric adsorption, high dielectric strength, very high insulating strength and a practically linear temperature coefficient in all temperature ranges.

All these properties make this film suitable for the manufacturing of power electronics capacitors.

However, the operating temperature is limited to 105°C.

POLYPHENYLENE SULFIDE (P.P.S.)

The properties of this film are as follows: very low dielectric losses, low temperature coefficient, high stability of the capacitance value, resistant to humidity and a high melting point. This material is suited for surface mounted precision capacitors (SMD). This film also has high temperature advantages and can be used for temperature up to 150°C.

PROPERTIES OF METALIZED FILM CAPACITORS

The metalized film consists of an extremely thin layer (some hundredths μm) of zinc or aluminum deposited by evaporation under vacuum on the dielectric. The nature, thickness and geometry of the metalized layer modify the properties of the capacitors, especially as far as permissible peak or effective current is concerned.

Metalized film capacitors are smaller than film-foil capacitors.

Self-healing is a fundamental property of these capacitors. When a dielectric breakdown occurs between the metal layers, due to a dielectric failure, an electrical arc causes local vapor deposition of the metallization which results in an insulating metallic oxide. Thus regenerated, the capacitor is once again operational.

The self-healing operation generally requires only a very small amount of energy (5 to 15 μJoules) and is performed in several $\mu\text{seconds}$ (< 50). However, a minimum amount of energy is required below which self-healing operations are unpredictable. This energy is calculated in relation to the capacitance value and the load voltage: $E = 1 / 2 CV^2$.

PROPERTIES OF FILM-FOIL CAPACITORS

Film Foil capacitors are especially recommended to meet high voltage or current and / or power stresses.

The thickness of the metal foil enables the reduction of the series resistance and improves the general performance of the capacitors. These improvements are made to the detriment of the volume of the capacitor which also loses its self-healing properties. Composite dielectrics combine films of different types with complementary specific characteristics.

For high voltage and power electronics applications, these capacitors are usually impregnated with impregnating fluids or solid substances.

CAPACITOR PERFORMANCE VS. TEMPERATURE

The capacitors' performance versus temperature essentially depends upon the dielectric type.

The figure below shows ranges of operating temperatures.

% OF CAPACITANCE CHANGE VS. TEMPERATURE (°C)

Important differences affect the laws governing the changes of the main electrical characteristics.

They are highlighted by the following curves:

% OF DISSIPATION FACTOR (DF) VS. TEMPERATURE (°C)

PROPERTIES OF DIELECTRIC FILMS

% OF DISSIPATION FACTOR (DF) VS. FREQUENCY (HZ)

A REAL CAPACITOR MAY BE REPRESENTED BY THE FOLLOWING DIAGRAM:

Series Inductance	Ls
Resistance of metal foil & connections	Rs
Insulation Resistance	IR
Dielectric Absorption	Cd
Resistance equivalent to the dielectric losses	R _D
Capacitance	C

Resistive terms generate temperature rises when the capacitors carry AC current (I_{rms}). Depending upon the frequency range, they may be more or less preponderant.

THE EQUIVALENT SERIES RESISTANCE (ESR) IS THE SUM OF THE FOLLOWING TERMS:

$$ESR = R_s + DF / C\omega + 1 / IR C^2 \omega^2$$

When the frequency increases, the term $1 / IRC^2\omega^2$ becomes rapidly insignificant.

For plastic dielectrics, losses remain constant within a wide range of frequencies and the affect of the term: $DF / C\omega$ decreases: $ESR = R_s + DF / C\omega$

The metal foil and the connections are designed to obtain a resistance value (R_s) as low as possible. This value is dependent on the capacitors' technology and geometry.

Inductance (L_s) also disturbs the equation of the capacitors at high frequencies.

IMPEDANCE (Z) IS STATED AS FOLLOWS:

$$Z = R_s^2 + (L_s\omega - 1 / C\omega)^2$$

When frequency increases, the affect of L_s will gradually cancel the capacitance component of the capacitors until it reaches the resonance frequency where:

$$Z = R_s \text{ and } LC\omega^2 = 1$$

IR VS. TEMPERATURE (°C)
